

Installation: Rattle & Squeak Eliminator Kit

Your Rattle & Squeak Eliminator kit contains 24" of adhesive backed felt padding and (2) alcohol prep pads. For years manufacturers have utilized this identical product on the assembly of interiors and more so today than ever before with all the plastic snap-together pieces.

You can cut and glue in place, wedge in place and even double up the felt when needed. By placing between two contact points the felt absorbs vibration and empty space, snugging the fitment of the parts while allowing for expansion and contraction. When installing a dashboard, dash bezel, gauge pod, A-pillar, reassembling from a recent repair or chasing down a longtime annoyance, strategically placing felt between any contact points, bolts, screws or plugs will help keep things quiet inside your truck.

Stopping a rattle before it starts reduces stress and increases your satisfaction with repair.

- 1) Cut off the amount of felt required.
- 2) Clean the mounting surface with the supplied alcohol prep pad.

- 3) Attach the felt and cut out the opening(s) as needed.
